Abstract of JP11232235

PROBLEM TO BE SOLVED: To attain efficient trading, to eliminate the need for a human operator and to shorten the searching time of a server to be required for a client.
SOLUTION: A 3rd trader GT acquires (103) the external evaluation information of a trader ST from a client side trader CT in addition to self-evaluation information acquired by an export (101) from a server side trader ST, sets up the received external evaluation information as the attribute information of the trader and provides (104) trader retrieval service using the attribute as a condition to a client side trader CT2. Since the trader GT executes retrieval using the self-evaluation information of the trader ST and the external evaluation information of the trader CT1 as conditions in addition to a service type, the client side trader CT2 can reduce overhead for retrieving the server providing necessary service under preferable conditions.
